

## **Light Weight Structural Fire Fighting Suit**

The Centre for Fire, Explosive and Environment Safety (CFEES), DRDO has developed a structural firefighting suit that has been engineered to offer increased flame-resistant protection and comfort level.

At present, the structural firefighting clothing being worn by the Indian firefighters conform to EN469. The structural fire-suits developed by CFEES, offers a much higher level of protection conforming to NFPA 1971 (Thermal Protective Performance > 44) without adding any weight obligation. The entire suit, including coat and trousers weighs < 2.8 kgs. The clothing developed is an ensemble of three layers; each having its own role to play.

### **Outer shell**

The most durable component of the fire suit's assembly, and has the following functions:

- Protects against heat and flames
- Protects against water and chemicals
- Protect against abrasion, cuts and lacerations

### **Moisture barrier**

The middle layer which helps the firefighters stays cooler and comfortable, by serving the following functions.

- Allows vapour to move out of the body.
- Provides extra protection against water penetration.
- Provides protection against heat and other chemicals.

### **Thermal barrier**

This is the innermost layer in the fire suit assembly, serving the following functions:

- Provides insulation by creating air cushions and micro climate chambers to favour comfort and minimize heat stress.
- Increases the wearer comfort level by wicking away moisture away from the body.
- Facilitates easy donning and doffing with a thin inner liner providing a sense of comfort.
- Protects the moisture barrier from any damage from within.
